

The Next Interface Is Human.

A brain-computer interface and robotics research partnership between the Human-Technology Interaction Lab and the Computing for Social Good Lab.

01 The current state

02 The gap

03 The precedent

04 The pairing

05 Six projects

06 The model

THE FRONTIER

You've industrialized AI for the product. The unexplored layer is the person.

Coca-Cola leads CPG in AI — marketing, flavor, supply chain. The human at the machine — intent, attention, affect, the hand that reaches for the drink — is still the frontier.

INTENT · ATTENTION · AFFECT · REACH

You have moved fast — on the product and the process.

MARKETING & CREATIVE	Project Fizzion with Adobe: brand governance across 200+ markets, content up to 10× faster. Create Real Magic with OpenAI and Bain.
PRODUCT & FLAVOR	Coca-Cola Y3000 — the first flavor co-created by humans and AI.
SUPPLY CHAIN	A \$1.1B Microsoft partnership across operations, inventory and demand forecasting.
R&D & SCIENCE	Project “Save the Orange” with Fundecitrus, Invaio and MIT — research timelines from years to months.
CONSUMER EXPERIENCE	Freestyle personalization, including Share a Coke on Freestyle.

Real, funded, and already at scale — every one of these is about the product.

Human?

02 · THE GAP

**None of it is about
the person at the
machine.**

The interface between a person and the system that serves them is still a touchscreen. Intent, attention, affect, accessibility — unaddressed.

You already fund university AI. This is not a cold ask.

MIT CONSORTIUM

Founding member of the MIT Generative AI Impact Consortium — the only CPG company, alongside OpenAI, Analog Devices, Tata Group and SK Telecom.

AUC × SAP

A multi-year data science partnership with Atlanta's HBCUs — 9,000 students, a virtual computing lab, and internships.

We are the brain-computer interface and robotics arm of the strategy you have already begun.

Two labs, one shared specialty: the human as interface.

HTIL · UNIVERSITY OF ALABAMA

Dr. Chris S. Crawford

Brain-computer interfaces and human-robot interaction

Reads attention, arousal and affect in real time

NeuroBlock — low-code neurofeedback programming

Low-cost physiological sensing hardware, ~\$4 BOM

NSF CAREER award

CFSG · UNIVERSITY OF FLORIDA

Dr. Juan E. Gilbert

National Medal of Technology and Innovation, 2023 · ACM Fellow

Brain-computer interfaces among core research areas

Human-centered computing, embodied and virtual humans

Prime III — open-source universal design, used in real elections

Applications Quest — patented equitable AI

Your AI reads the market. Ours reads the human — from electrode to embodied robot.

Six projects at the brain–machine boundary.

A

The Responsive Pour

Human-state personalization

B

The Hands-Free Pour

Accessible BCI control

C

The Living Lab

Robot hosts at live venues

D

The Experience Signal

Neurophysiological measurement

E

NeuroBlock Studio

Low-code BCI & robot authoring

F

The Serving Arm

Service & assistive robotics

Each is a research question — designed to produce peer-reviewed results and protectable IP.

The responsive pour.

WHAT WE BUILD

Dispensing that reads engagement and arousal from non-invasive EEG — never identity — and adapts the Share-a-Coke moment in real time, inside a consent-first architecture.

WHY IT MATTERS TO COCA-COLA

Personalization past purchase history to how the person actually feels — without covert sensing or stored profiles.

The hands-free pour.

WHAT WE BUILD

A brain- and body-controlled interface — attention, gaze and physiological signals — that selects and pours without touching the machine, on a low-cost sensing stack.

WHY IT MATTERS TO COCA-COLA

Serves motor-impaired and aging customers, sterile settings, and anyone whose hands are full. Accessible beverage control as a first principle, not a retrofit.

Universal design method, proven in public elections, applied to the dispenser.

The living lab.

WHAT WE BUILD

Embodied hosts — robotic and virtual agents — at sponsored venues, with physiological sensing to measure moment-to-moment engagement and human-robot trust.

WHY IT MATTERS TO COCA-COLA

Turns sponsorship, including the FIFA World Cup 2026 footprint, from logo exposure into measured experience science.

The experience signal.

WHAT WE BUILD

An ethics-governed instrument measuring attention and engagement with products using EEG and physiological signals — neuromarketing moved to the point of choice.

WHY IT MATTERS TO COCA-COLA

An honest, independent read on what resonates — and a defensible framework for doing it responsibly.

SHELF · DISPENSER

SENSED ATTENTION & AROUSAL

INSIGHT

NeuroBlock Studio.

WHAT WE BUILD

NeuroBlock’s block-based paradigm rebuilt as an authoring toolkit, so experiential and agency teams compose brain- and robot-driven experiences without a neuroscientist in the room.

WHY IT MATTERS TO COCA-COLA

One-off activations become a reusable capability — faster ideation, lower cost, and a shared language between marketers and engineers.

Proven paradigm, new audience: the people who actually build your activations.

The serving arm.

WHAT WE BUILD

A BCI-driven robotic pour-and-hand-off system: assistive for users who cannot operate a dispenser, hospitality robot for high-traffic venues.

WHY IT MATTERS TO COCA-COLA

A credible entry into service robotics for beverage, with the human-factors evidence most deployments skip.

THE RETURN

Not a vendor. A research partner.

01 IP

Peer-reviewed BCI and robotics results alongside your dispensing portfolio — co-owned under a negotiated agreement.

02 DE-RISKED INNOVATION

Small, evidence-backed pilots before any large commitment.

03 CREDIBILITY

Human-interface and robotics claims backed by independent university research, with an ethics framework built in.

04 TALENT

A pipeline to trained graduate researchers in BCI, HRI and physiological computing.

How we would work together.

"You have engineered the drink and automated the supply chain. The human at the machine is the **last interface** left."

HTIL × CFSG — a proposed BCI and robotics partnership with The Coca-Cola Company.

THE ASK: A 90-DAY SCOPING SPRINT TO PICK THE FIRST TWO PROJECTS.
